Assignment 1017 Feedback

Michael A. Fraser

mfraser42

3a — Your work shows a decent understanding of how user interfaces are constructed. You have implemented a variety of elements yet have put them together in a fairly coherent if somewhat ordinary way. On the subjective side, I would tweak your color scheme somewhat, but that's just me. (+)

3c — Your code generally respects MVC well. (+)

4a — Your code is functionally complete based on what the assignment requested. It is sort of bare-minimum complete, but that's still complete. There are assorted inline feedback comments in the code; do scan them for points of improvement. One negative that stands out is the proliferation of obsolete code. Those comment blocks are pretty distracting; you are on version control anyway, so be bold and just delete code that you won't need/use anymore. (!)

4b — Separation of concerns is done well here. One particular block of code seems to reside in the wrong *.js* file (the `#random_item` button click handler), but other than that things look pretty clean. (+)

4c — By and large, your code is correctly indented and well-spaced. Some constructs would have been formatted differently by me (see those inline comments again), but otherwise well-done. You also have the occasional spacing inconsistency; you want to address that so that code structures always look the same across the board. This in turn will enhance code readability. Finally, you have an occasional tendency to run things along one looong line. You can be more generous than that, in the name of better code readability and, to some degree, maintenance. (+)

4d — You appear to have generally used the resources and documentation at your disposal pretty well. (+)

4e — You committed your work with good frequency and informative messages. Keep it up! (+)

4f — Submitted to GitHub on time; *my.cs.lmu.edu* site also live at time of grading. (+)
